

QPage

version 1.9

Overview

- We developed QPage on Windows but it also runs in Linux and Mac-OSX. QPage is written in Python3, in order to run it, you will need a python interpreter.

Dependencies

- [Download](#) and install last version of python3 (*or use exe-file and skip this step*)

Installation

- Directly
 - [Download](#) Qpage source or [exe-file](#)
 - Just Unzip It!
- pip ([Tutorial](#))
 - open cmd (in windows) or terminal (in linux) and type (python get-pip.py) to install pip
 - type (python pip install qpage)

Usage

- Run setup (for the first use to create folders)
- Put your profile picture in image folder (jpg , bmp , tiff , gif , png)
- Put each page details in a text file with page name in doc folder (* In this step you can use [M] , [S] or [L] at the start and [center] at the end of each line to control font size and alignment)
- Put your resume file (pdf format) in doc folder
- Put your font file in font folder (*Optional) suggested site --> [Google Fonts](#)
- Put your icon file in image folder (*Optional) suggested site --> [IconArchive](#)
- Run again setup
- Enter your name
- Choose your profile image size
- Choose your text and background color
- You can preview your webpage
- Finished!!! Now you can go and upload output folder contains directly in your host
